Importante:

1. Questo catalogo deve essere utilizzato come indicazione generica. Differenti condizioni di guida possono richiedere candele più fredde.
2. Questa edizione annulla quelle precedenti.
3. Non si assume alcuna responsabilità causata o derivata dal presente catalogo.
4. Le applicazioni di questo catalogo non devono essere riferite a motori installati su velivoli.

LPG LaserLine

una gamma esclusiva di candele.

Sino ad oggi non esisteva una linea di candele destinata ai motori a gas: ora **NGK** ha sviluppato **LPG LaserLine**.

- Gamma per i motori alimentati a GPL e Metano.
- Design degli elettrodi con riporti di Platino ed Iridio saldati a laser.
- Rivestimento speciale per corpo metallico: protegge la candela e ne facilita lo smontaggio.
- Installazione facile: il gap è già impostato correttamente.
- Oltre il 95% di copertura del mercato con soli otto codici.

LPG LaserLine

dedicate ai motori alimentati a gas.

LPG LaserLine è la prima gamma di candele d'accensione sviluppate appositamente per i motori alimentati a gas: ora è finalmente possibile trovare la candela corretta ed affidabile.

In tutta Europa sono molti gli automobilisti che decidono di alimentare la propria vettura con il gas, il loro numero aumenta in maniera esponenziale di anno in anno; ora anche voi potrete cogliere questa nuova opportunità di mercato.

In passato la scelta della candela corretta per questo tipo di alimentazione era completamente empirica ed implicava diversi fattori: questo significava sicuramente una bassa efficacia del vostro lavoro.

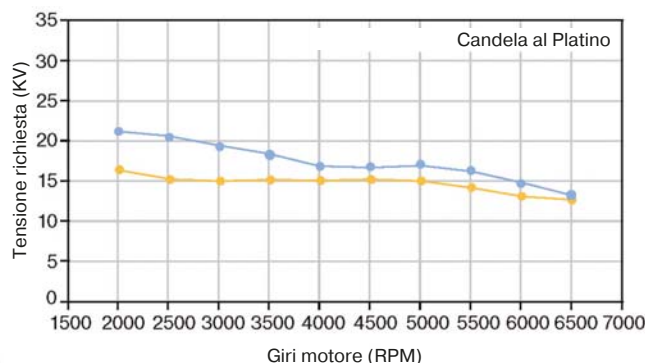

L'accensione del gas liquido è più difficoltosa di quella della benzina, la tensione richiesta è maggiore - come si intuisce nel diagramma a lato - insieme al rischio di mancate accensioni, che come sapete danneggiano il catalizzatore.

Inoltre la miscela aria/gas brucia a temperature molto più elevate: gli elettrodi e il rivestimento delle candele sono soggetti ad una maggiore erosione, e le candele devono anche disperdere questo maggior calore. Per cercare di risolvere questi problemi si preferiva scegliere, anziché una candela standard, un'alternativa con metalli pregiati più resistenti ed un grado termico differente, oltre a seguire eventuali suggerimenti (pericolosi e assolutamente sconsigliati da **NGK**) di aggiustamento del gap.

Ma ora c'è la soluzione: la gamma **LPG LaserLine NGK**. Questa linea copre più del 90% del mercato potenziale in Europa, e in alcuni paesi arriva addirittura al 97%: in sostanza, **LPG LaserLine NGK** è la gamma ideale per la maggior parte delle vetture circolanti.

La tensione richiesta per l'accensione aumenta nei motori alimentati a gas.

Benzina super: — Distanza tra gli elettrodi (gap) 0,80 mm
Gas liquido (GP): — Distanza tra gli elettrodi (gap) 0,80 mm

LPG LaserLine

i vantaggi per i motori alimentati a gas.

1. Elettrodi high-tech

Le candele **LPG LaserLine NGK** presentano un elettrodo centrale con riporto in lega all'Iridio e un elettrodo di massa con riporto in lega al Platino, entrambi saldati al laser con una tecnologia **NGK** brevettata in esclusiva. Vantaggi: i metalli pregiati sono resistenti alle condizioni estreme presenti nei motori alimentati a gas, e la distanza tra gli elettrodi rimane praticamente inalterata per tutta la durata di esercizio della candela.

2. Minore tensione richiesta

Studi condotti da dimostrano che la tensione necessaria per l'accensione nei motori alimentati a gas è superiore fino a 7.000 volts rispetto ai motori alimentati a benzina, quindi viene richiesta il massimo della performance alle candele. L'elettrodo centrale di una candela **LPG LaserLine NGK** presenta un diametro di soli 0,6 mm e quindi richiede una tensione ridotta.

3. Migliore accendibilità

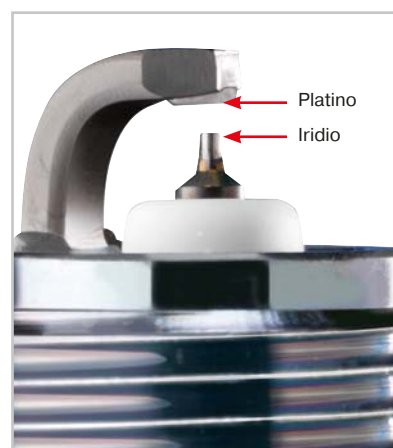

Grazie alle dimensioni ridotte degli elettrodi e all'anima in rame della candela la dissipazione del calore è notevolmente migliorata. Inoltre il particolare design dell'elettrodo centrale fa sì che il nucleo di fiamma si espanda rapidamente verso l'esterno e protegge la candela da eventuali depositi carboniosi.

4. Il rivestimento fa la differenza

Il corpo metallico di ogni candela **LPG LaserLine NGK** è rivestito di una speciale lega di cromo: questo materiale è in grado di sopportare più a lungo l'erosione creata dalla combustione della miscela di gas. Attualmente non sono disponibili sul mercato altre candele con un rivestimento con queste caratteristiche.

5. Il gap corretto

La distanza tra gli elettrodi (gap) di ciascuna candela **LPG LaserLine NGK** è stata già impostata correttamente per i motori alimentati a gas. Non sono quindi necessari eventuali aggiustamenti del gap, che sono comunque assolutamente sconsigliati.

Elettrodo centrale con riporto in lega all'Iridio ed elettrodo di massa con riporto in lega al Platino, entrambi saldati al laser: accensioni sicure e il massimo della resistenza per tutta la durata di esercizio.

LPG LaserLine

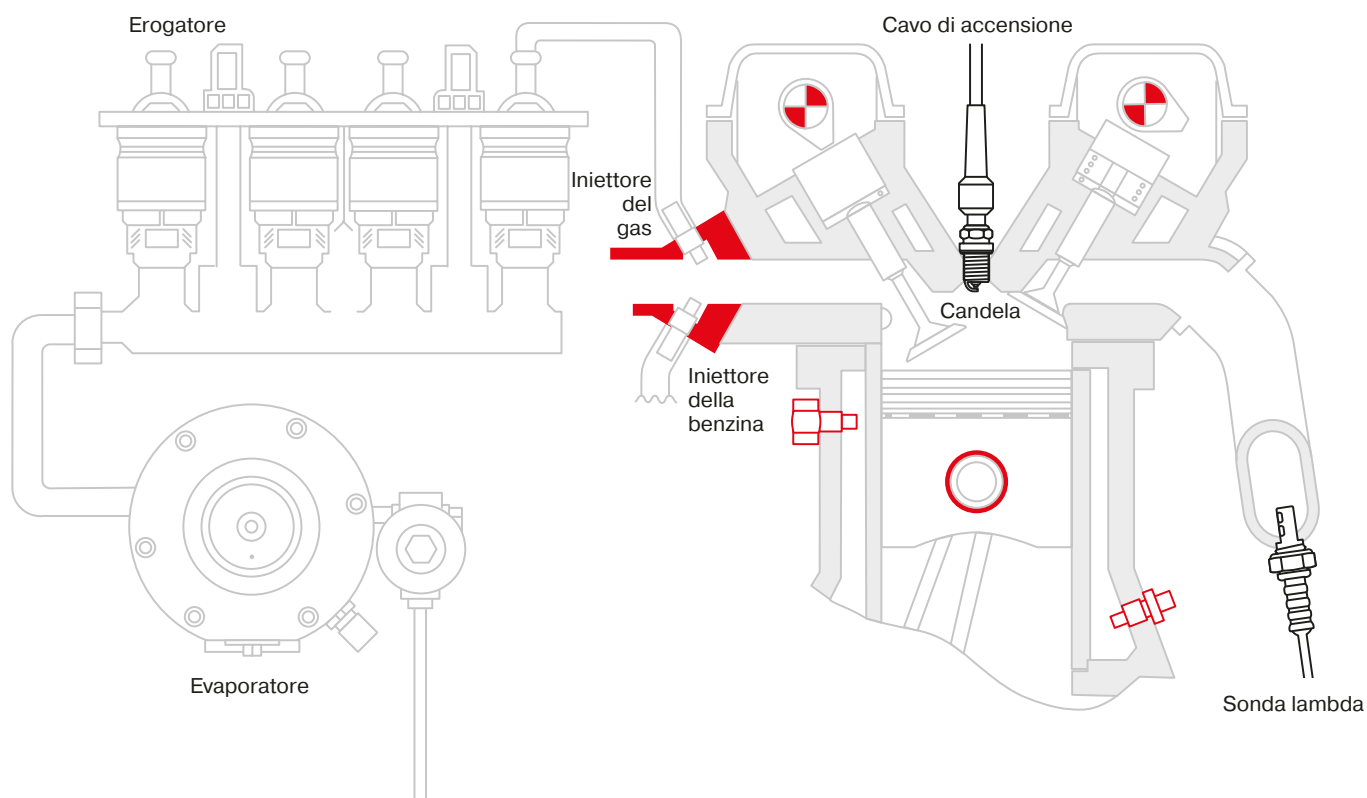

ottima copertura di mercato.

La gamma LPG LaserLine **NGK** comprende otto codici per oltre il 95% delle vetture sulla quali è possibile installare un impianto a gas in Europa.

La tabella mostra alcuni esempi di applicazioni delle candele **LPG LaserLine**: tutte queste vetture sono presenti nel catalogo candele **NGK** 2011/2012, in TecDoc e online su: www.ngk.it

Esempi di applicazioni

V-Line, la candela degli specialisti dell'aftermarket

Vantaggi della serie V-Line:

- **Identificazione numerica:**
I numeri da 1 a 39 facilitano il ricorso e la scelta della corretta candela.
- **Confezione attraente:**
Stimola l'acquisto spontaneo e facilita la rivendita.
- **Dimensioni:**
Il meglio nel minimo spazio.
- **Veloce rotazione dello stock:**
39 tipi per il 97% del mercato. Miglior ritorno sull'investimento.
- **Riduzione dei costi:**
Minori costi di immagazzinamento.
- **Promozione sul punto di vendita:**
Appositi espositori valorizzano il prodotto.
- **Riduzione dell'inquinamento:**
Accensioni più sicure riducono il consumo di carburante, le emissioni nocive e prolungano la vita del catalizzatore. Anche l'imballo in cartone viene prodotto con un maggior rispetto dell'ambiente.

La linea completa è disponibile in uno speciale display a pavimento, corredato da una completa tabella di applicazione.

Le confezioni da 4 candele - insieme ad una pratica guida di applicazione - possono essere agganciate alle comuni rastrelliere per blister. Il sistema di identificazione numerica (da 1 a 39) facilita la scelta del prodotto.

Il display contiene 39 tipi differenti di candele - in totale 700 - per una copertura ottimale del parco circolante.

V-Line: Vantaggi su tutta la linea

1. Accensione sicura:

Maggior protezione dell'ambiente

Il pericolo delle mancate accensioni - che comportano un maggior consumo di carburante e maggiori emissioni inquinanti - viene ridotto al minimo dalle caratteristiche costruttive delle candele V-Line.

2. Accensione sicura:

Maggior protezione del catalizzatore

La durata del catalizzatore è fortemente ridotta dalle mancate accensioni, spesso non percettibili. Le candele V-Line, per le loro caratteristiche di elevata accendibilità, offrono una efficiente protezione.

3. Sicurezza per l'automobilista:

Elevato standard Qualitativo

Le candele NGK sono state riconosciute come un prodotto di elevata qualità. Sono state infatti scelte dai migliori costruttori nel mondo, a partire da Alfa, BMW, FIAT, Honda, Mazda, Mitsubishi, per finire con Renault, Rover, Saab, Seat, Toyota, Vw.

V-Line N° 31, 34, 37
1 elettrodo di massa

V-Line Caratteristiche tecniche

V-Line N° 1, 21, 22, 24, 27, 29

Candele con tre elettrodi di massa per VW ed Audi. La NGK produce questo tipo di candele principalmente per motori **VW** ed **Audi** e possono essere installati sulla quasi totalità dei nuovi modelli (vedi catalogo applicazioni).

Vantaggi tecnici

La speciale composizione della ceramica consente la produzione di un isolatore con la punta molto sottile, mentre il nucleo dell'elettrodo centrale, in rame, è stato ottimizzato. Questi due fattori contribuiscono a migliorare lo smaltimento del calore ed assicurano partenze immediate ed un affidabile funzionamento, anche nelle condizioni operative più severe.

V-Line N° 2-12, 14-19, 28, 32, 33, 35, 36, 38, 39

Candele con elettrodo centrale scanalato a "V"
Brevetto no. DE 2922 305 C2

Il principio è semplice, ma molto efficace: sulla punta dell'elettrodo centrale viene praticata con precisione una scanalatura a «V» di 90°. La scintilla viene quindi costretta a scoccare dal bordo dell'elettrodo, in un'area in cui si trova una maggiore quantità di miscela aria e carburante rispetto a quella tra lo spazio fra due elettrodi convenzionali. Ed in più, in quest'area, la tensione richiesta per la scintilla è minore. Ciò significa migliore accendibilità.

Le caratteristiche costruttive delle candele NGK assicurano sempre una corretta accensione della miscela aria-carburante, anche nei motori più moderni progettati molto «magri» per ridurre le emissioni inquinanti.

V-Line N° 20, 23

2 elettrodi di massa

Le nuove candele per la BMW si basano sul principio di catturare la scarica elettrica che scorre sulla superficie dei depositi e creare una scintilla. La scintilla avviene tra l'isolatore e l'elettrodo di massa favorendo l'eliminazione dei depositi carboniosi ed innescando la miscela aria/carburante.

V-Line N° 30

4 elettrodi di massa

Questa candela con elevato intervallo di sostituzione è il risultato di una stretta collaborazione tra i tecnici NGK e quelli BMW. La candela BKR6EKUP presenta un elettrodo centrale al platino, quattro elettrodi di massa ed è l'ultima nata tra le candele a scarica semi-superficiale. Le candele a scarica semi-superficiale si basano sul principio per cui la scintilla scorre sempre sulla punta dell'isolatore raggiungendo l'elettrodo di massa. In tal modo viene garantita la pulizia continua della superficie dell'isolatore dai depositi incombusti, permettendo in ogni condizione lo scoccare della scintilla. Questo garantisce ottime partenze a freddo e ottima accendibilità, anche quando la vettura viene guidata solo per brevi distanze.

Questo nuovo tipo di candela NGK viene installato su motori BMW a partire dall'anno 1997 ed è stata ottenuta anche l'omologazione retroattiva per alcuni modelli più datati, a partire dall'anno 1987.

V-Line Caratteristiche tecniche

La V-Line N° 25

Per i modelli Ford equipaggiati con motori ZETEC, NGK ha sviluppato le candele doppio platino PTR5A-13. Gli elettrodi in platino riducono il fabbisogno di tensione consentendo un aumento della distanza fra gli elettrodi con un miglioramento della combustione anche ai bassi regimi (minimo più stabile) ed assicurano migliori accelerazioni e minor livello di emissioni inquinanti.

La V-Line N° 26

In collaborazione con FIAT, NGK ha sviluppato la candela BKR6EKC. La "C" della sigla identifica una candela speciale per i motori del gruppo FIAT. La BKR6EKC funziona perfettamente anche nelle condizioni più difficili, sia nella marcia in città ai bassi regimi che alle alte velocità. I risultati dei tests dimostrano che il disegno particolare dei due elettrodi di massa garantisce sicure accensioni ed una durata che rientra nell'intervallo di sostituzione richiesto da FIAT.

Le V-Line N° 31, 34, 37

Per i modelli Ford equipaggiati con motori ENDURA, NGK ha sviluppato le candele doppio platino PTR5D-10. Gli elettrodi in platino riducono il fabbisogno di tensione consentendo un aumento della distanza fra gli elettrodi con un miglioramento della combustione anche ai bassi regimi (minimo più stabile) ed assicurano migliori accelerazioni e minor livello di emissioni inquinanti.

(1) ISO: la lunghezza dalla guarnizione al terminale della candela del tipo ISO è di 50.5 mm ed è 2.5 mm più corta delle candele BCP-E e BC-E.

(2) E' necessario utilizzare cappucci speciali.

(3) Le candele resistive sono consigliate per veicoli equipaggiati con cappucci resistivi.

Il box grigio indica una candela resistiva

Come è fatta una candela racing?	pag. 34
Quali tipi di candele offrono una migliore resistenza ai residui carboniosi	pag. 35
Esistono altri tipi di candele speciali?	pag. 36

INFORMAZIONI PRATICHE

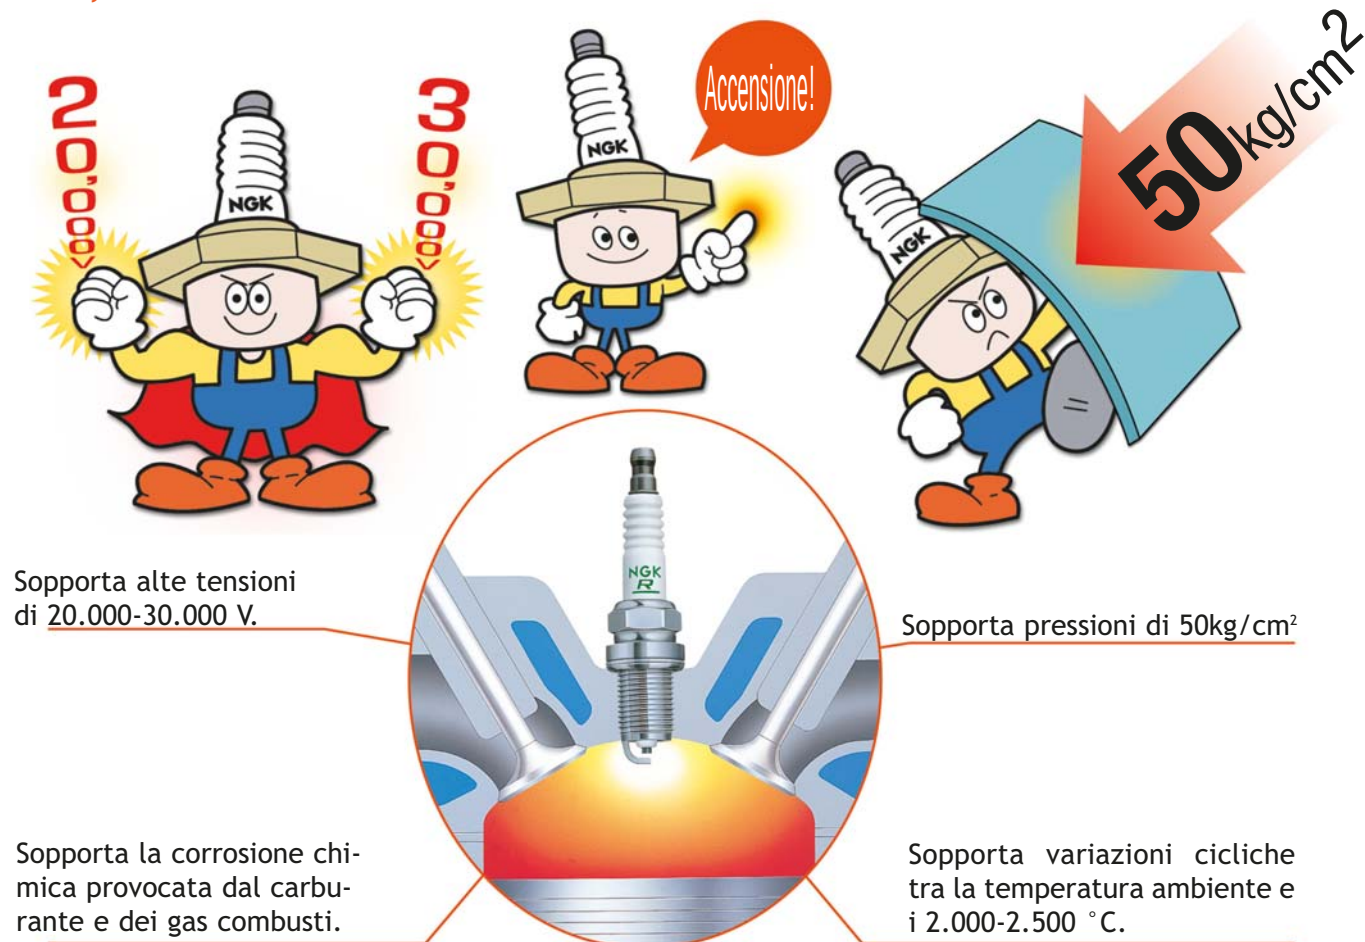

Che cosa si intende per imbrattamento di una candela?	pag. 37
Che cosa si intende per surriscaldamento di una candela?	pag. 38
Che cosa si intende per performance d'accensione?	pag. 39
L'alone giallo-bruno tra corpo metallico e isolatore è causato dal trafilamento dei gas?	pag. 40
Quali precauzioni si devono prendere durante l'installazione delle candele?	pag. 41
Oltre a verificare il corretto grado termico, quali altre precauzioni bisogna adottare durante l'installazione delle candele?	pag. 42
Perché è necessario sostituire la candela?	pag. 43

Quale è la funzione di una candela?

Serve ad incendiare la miscela aria/carburante.

Deve funzionare in condizioni estreme.

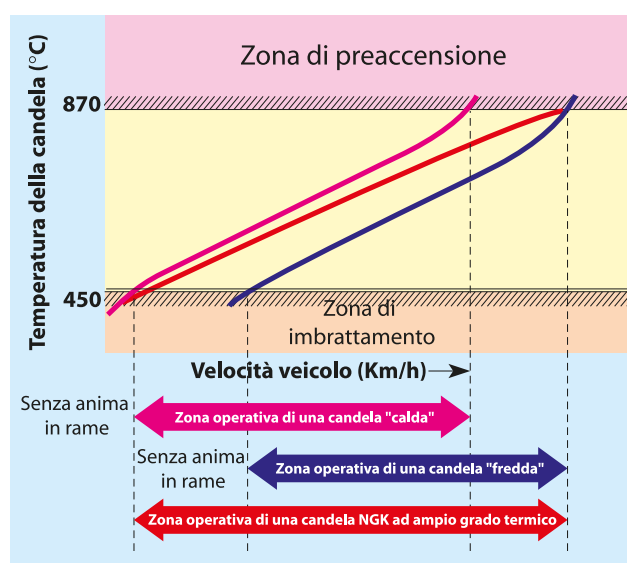

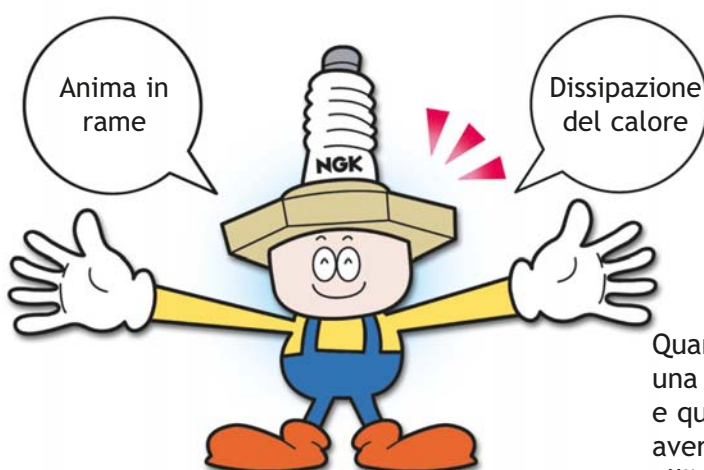

Quali sono i punti di forza delle candele NGK?

Progettazione volta a fornire al motore le massime prestazioni a tutti i regimi, uso di materiali innovativi e tecniche costruttive all'avanguardia.

1

Campo di utilizzo compreso tra 450°C e 870°C

L'elettrodo centrale con anima in rame, rivestito esternamente da nickel, consente una più rapida dissipazione del calore. Ciò al fine di migliorare le caratteristiche termo-elastiche della candela.

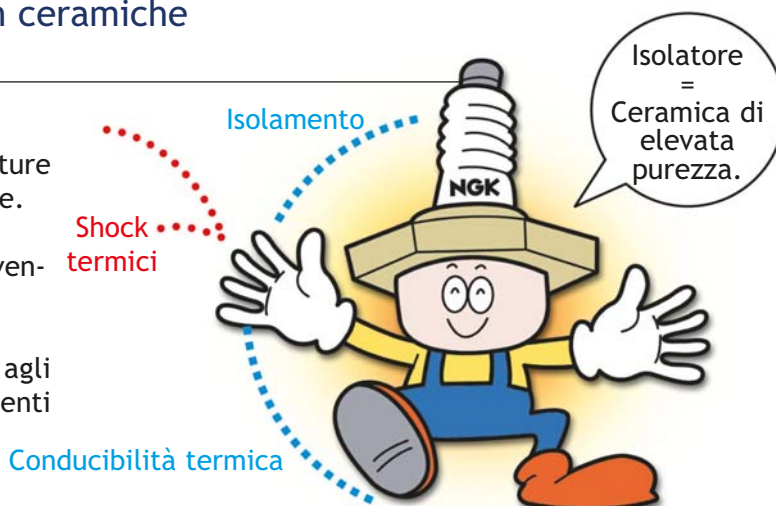

Quando si comparano le caratteristiche termiche di una candela con elettrodo centrale con anima in rame e quelle di una con elettrodo in nickel, la prima risulta avere una maggiore resistenza alle alte temperature e all'imbrattamento consentendo una zona operativa di funzionamento più ampia.

2

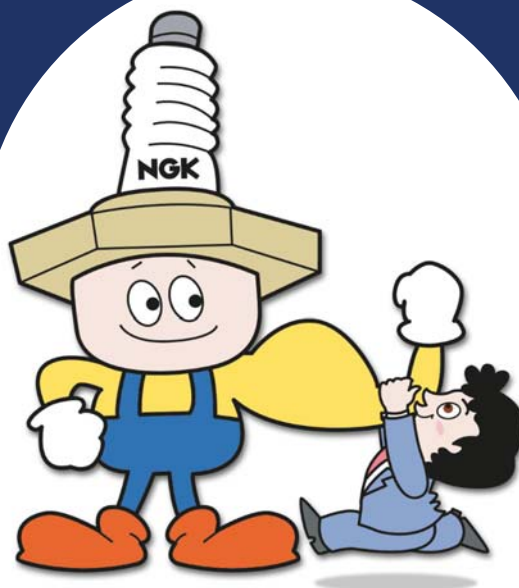

L'isolatore è prodotto con ceramiche di elevatissima purezza.

- Migliore isolamento alle alte temperature per assicurare una corretta accensione.
- Elevata conducibilità termica e prevenzione del surriscaldamento.
- Maggior resistenza meccanica ed agli shock termici (improvvisi raffreddamenti o innalzamenti di temperatura).

3

La particolare tecnica costruttiva assicura una tenuta ermetica contro il trafilamento dei gas della combustione.

Speciali polveri interposte tra isolatore e corpo metallico assicurano la perfetta tenuta contro il trafilamento dei gas e contribuiscono ad irrobustire la candela.

4

La punta dell'elettrodo centrale è rivestita da una speciale lega di nickel.

La maggior resistenza alle alte temperature della lega speciale di nickel assicura maggiore durata della candela.

Terminale ad oliva

Coste

Le cinque coste garantiscono un migliore isolamento e contribuiscono ad impedire le scariche esterne.

Marchio e Codice

Il tipo di candela dipende dal motore.

Resistore

Corpo metallico

Trattamento superficiale con cromo e zinco per resistere alla corrosione.

Lunghezza della filettatura

Diametro della filettatura

Isolatore

Prodotto con i migliori materiali ceramici garantisce un eccellente isolamento, resistenza al calore e conducibilità termica, elementi fondamentali per una candela.

Polvere sigillante

Assicura un'ottima protezione contro il trafilamento dei gas ed irrobustisce la candela.

Guarnizione

Lo speciale disegno della guarnizione impedisce il trafilamento dei gas della combustione.

Anima in rame

Migliora la dissipazione del calore e garantisce un più ampio campo di utilizzo assicurando un'ottima accendibilità a tutti i regimi.

Distanza tra gli elettrodi (gap)

Elettrodo centrale e di massa

Ricoperti con lega di nickel che assicura ottima durata e migliora la conducibilità termica.

Componenti della candela

Che cosa si intende per grado termico?

La candela deve dissipare il calore prodotto dalla combustione. Il grado termico è la misura della capacità di smaltimento del calore prodotto dalla miscela aria carburante in camera di combustione.

Il grado termico è espresso da un numero.

Presenta una maggiore superficie dell'isolatore esposta ai gas della combustione.

Dissipa il calore lentamente.

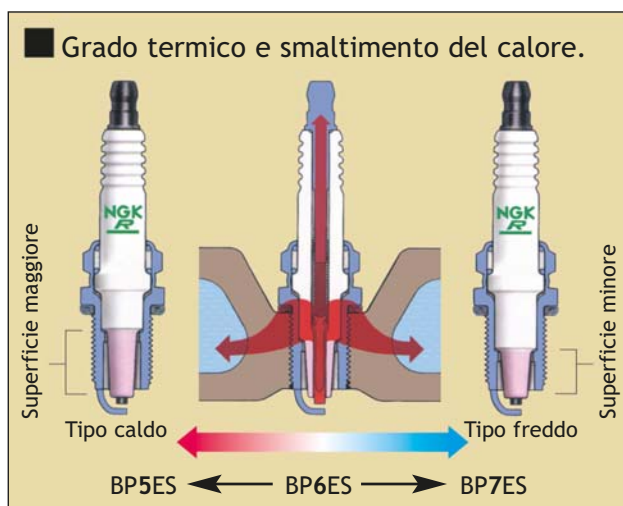

La punta si scalda rapidamente.

Presenta una minore superficie dell'isolatore esposta ai gas della combustione.

Dissipa il calore rapidamente.

La punta non si scalda rapidamente.

MEMO

E' fondamentale utilizzare la candela che rispetti le caratteristiche stabilite dal costruttore del veicolo.

- Se il grado termico è troppo freddo:
 - > La temperatura della candela rimane troppo bassa favorendo la formazione di depositi carboniosi che possono far scaricare la scintilla a massa.
- Se il grado termico è troppo caldo:
 - > La temperatura della candela sale troppo, innescando la pre-accensione; ciò può causare sia la fusione dell'elettrodo che il danneggiamento del pistone.

Come si identificano le candele NGK?

Ecco il significato

Diametro filettatura/ esagono		Struttura		Resistore		Grado termico	
A	18mm / 25,4	P	Punta isolatore prominente	R	Candela resistiva	2	candela calda candela fredda
B	14mm / 20,8	M	Candela compatta del tipo Bantam	Z	Resistenza induttiva	4	
C	10mm / 16,0	U	Candela a scarica superficiale o semisuperficiale			5	
D	12mm / 18,0					6

Quale è il modo migliore per scegliere una candela?

E' fondamentale selezionare dal catalogo NGK una candela che rispetti le caratteristiche stabilite dal costruttore del veicolo.

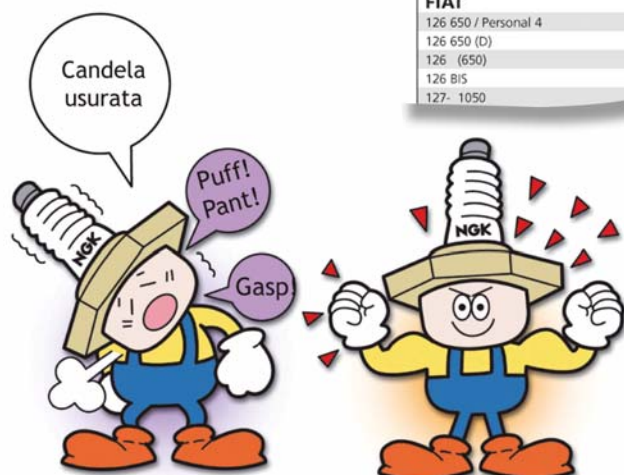

Esempio di scelta corretta

- Modello: Ferrari F400i/automatic
- cilindrata: 4.8
- Anno: 05.79/03.85

MEMO

La candela è un componente soggetto ad usura, la sua durata non è illimitata anche se è stata scelta correttamente. E' necessario effettuare controlli con frequenza regolare e, nel caso, sostituire la candela.

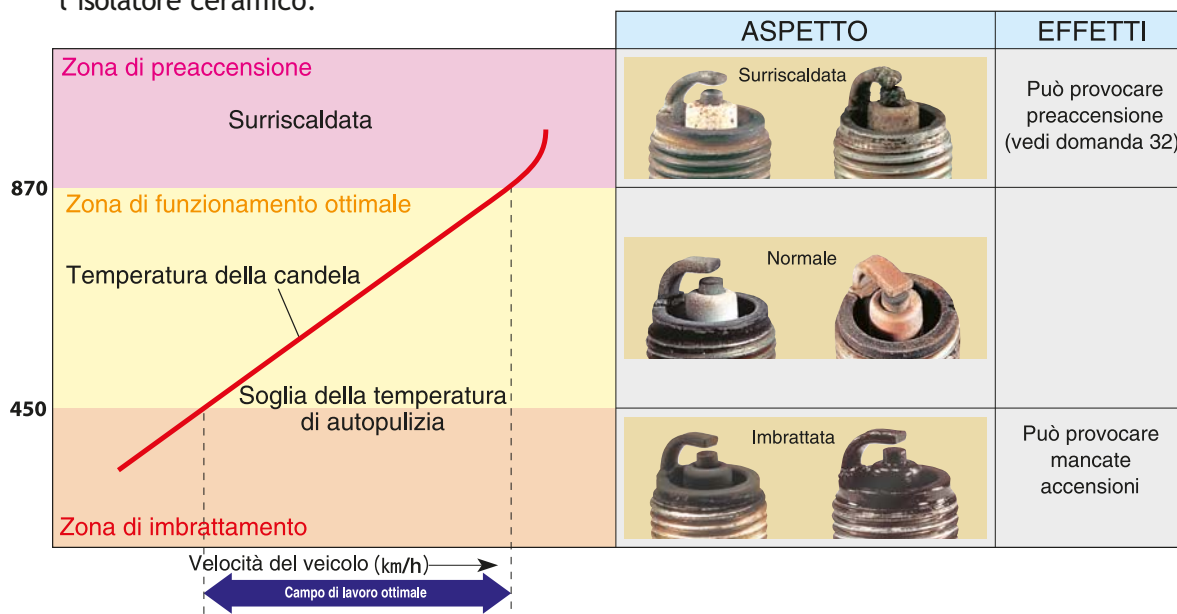

Perché è importante l'aspetto della punta dell'isolatore?

Perché riflette "lo stato di salute" della candela così come le condizioni del motore.

Le condizioni fondamentali di funzionamento sono tre: normale, di imbrattamento e di surriscaldamento e dipendono principalmente dalla temperatura di funzionamento della punta dell'isolatore.

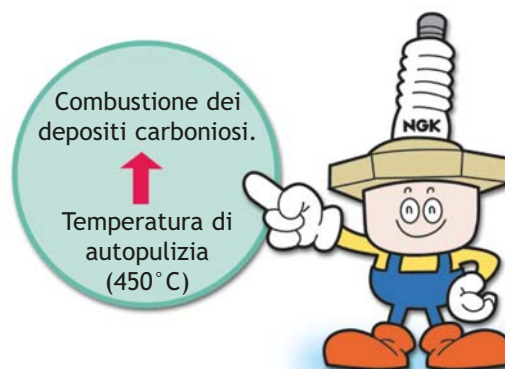

Temperatura ed aspetto della punta dell'isolatore ceramico.

MEMO

La linea di confine tra la zona di imbrattamento e quella di funzionamento ottimale si chiama soglia della temperatura di autopulizia. A questa temperatura, i depositi carboniosi accumulati ai bassi regimi vengono bruciati liberando la punta dell'isolatore.

N.B. L'eccesso di depositi carboniosi sull'isolatore ceramico, determina un decadimento delle caratteristiche dell'isolatore della candela fino a comprometterne l'accendibilità.

Quali funzioni hanno le coste dell'isolatore?

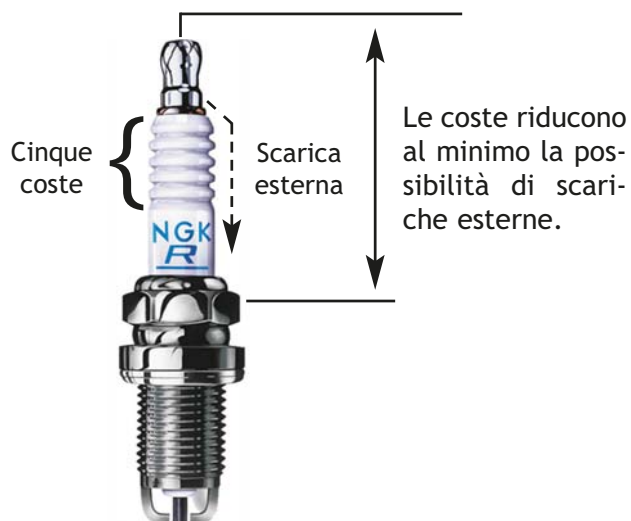

Assicurano l'isolamento e proteggono dalle scariche esterne.

Durante l'accensione:

Viene applicato un voltaggio elevato nell'area compresa tra il terminale alta tensione ed il corpo metallico.

L'alta tensione può tendere a disperdersi lungo la superficie esterna dell'isolatore provocando una **scarica esterna**

La scintilla non scocca tra gli elettrodi e si verifica una mancata accensione.

Per evitare che ciò accada:

Le coste sono ricavate sull'isolatore per aumentare la superficie totale.

Aumenta la distanza che la scintilla deve percorrere tra il terminale ed il corpo metallico.

Mantengono regolare lo scoccare della scintilla.

Resistenza alle scariche esterne in KV

	Resistenza alle scariche esterne in KV				
	15	20	25	30	35
Cinque coste					
Senza coste					

La tabella indica chiaramente come una candela con 5 coste sopporti una tensione di 30.000 V senza dar luogo a scariche esterne, mentre ciò avviene già a 20.000 V nel caso di un isolatore senza coste.

Come è fatta una candela resistiva?

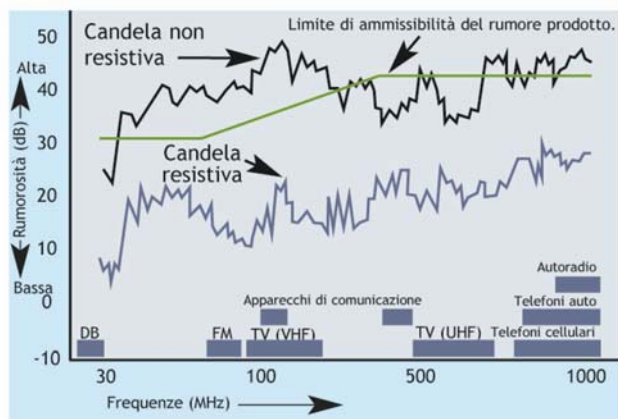

E' una candela che incorpora un resistore ceramico per sopprimere le radiointerferenze generate dallo scoccare delle scintille.

Caratteristiche

Incorpora un resistore ceramico del valore medio di 5 KOhm.

Elimina le radiointerferenze generate dallo scoccare delle scintille.

Sopprime le interferenze che disturbano l'autoradio o il telefono cellulare, ma che soprattutto possono causare anomalie nel sistema di iniezione, all' ABS e alla strumentazione elettronica.

Come si vede chiaramente dal grafico sopra, una candela resistiva riduce le interferenze per tutte le bande di frequenza

Resistore ceramico del valore medio di 5 KOhm

Esempio di codice di una candela resistiva

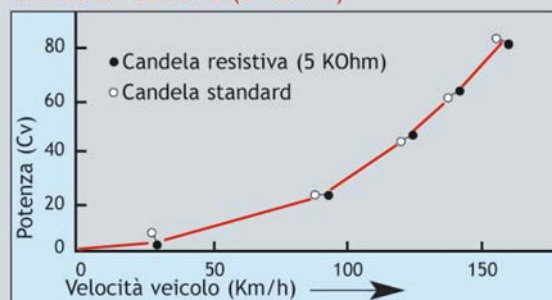

BK R 5ES-11

Candela resistiva

MEMO

La candela resistiva non influisce in modo alcuno sul rendimento specifico del motore (utilizzo a pieno regime, accensione, accelerazione, ecc.).

Candela resistiva (5 KOhm)

Come è fatta una candela V-grooved?

E' una candela che presenta una scanalatura a V di 90° all'estremità dell'elettrodo centrale.

Specifiche

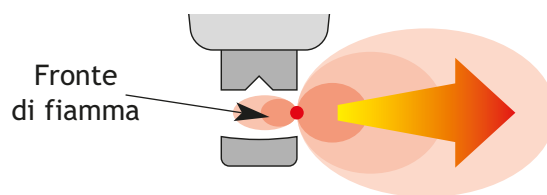

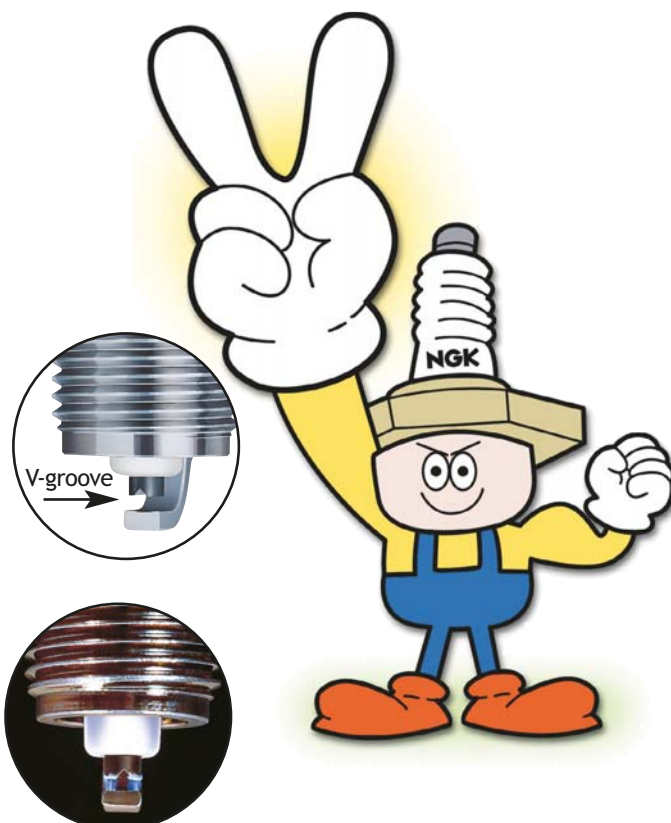

La scanalatura all'estremità dell'elettrodo centrale ha un angolo di 90°.

La candela V-grooved è costruita in modo che la scintilla scocchi dal bordo dell'elettrodo.

Il fronte di fiamma è generato in prossimità del bordo dell'elettrodo e si espande verso l'esterno.

Ciò migliora l'accendibilità.

- Migliora le prestazioni facilitando l'avviamento, le accelerazioni e rende il minimo più stabile.
- Riduce il consumo di carburante.

Il nucleo di fiamma viene generato in prossimità del bordo dell'elettrodo e aumenta in misura maggiore verso l'esterno che verso l'interno della candela.

Com'è fatta una candela Iridium IX?

Questa candela presenta un elettrodo centrale con riporto all'iridio saldato al laser.

Grazie alle caratteristiche di questo nuovo materiale e al particolare disegno dell'elettrodo di massa e di quello centrale, questa candela garantisce una migliore accendibilità (anche alle più basse temperature), evitando l'imbrattamento in ogni condizione di guida.

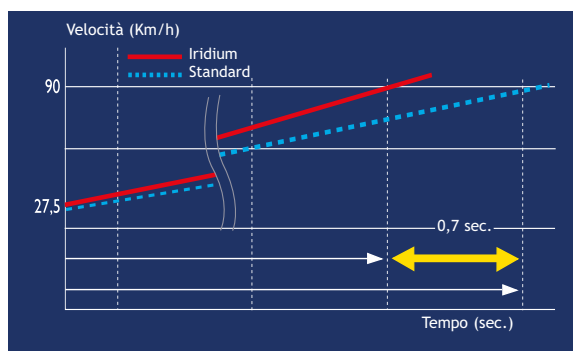

Caratteristiche

Il diametro dell'elettrodo centrale è molto sottile.

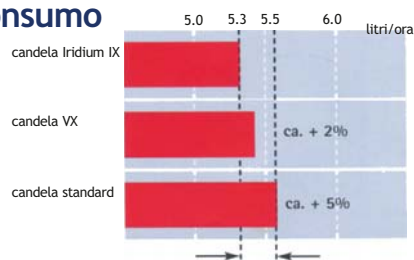

La migliore accendibilità evita l'imbrattamento in ogni condizione di guida.

Accensioni sicure, combustione omogenea e prestazioni del motore ottimali sono il risultato di una tecnologia modernissima che riduce il consumo di carburante.

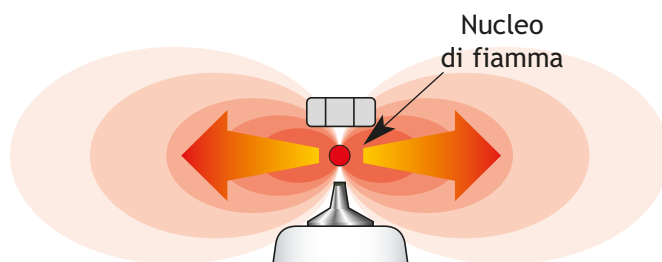

Accelerazione più potente

Consumo

Risparmio di carburante fino al 5% rispetto alle candele standard

Poiché l'elettrodo centrale è molto sottile, il nucleo di fiamma si espande rapidamente verso l'esterno.

Esempio di codice candela IX

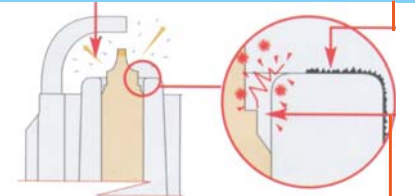

BKR5E IX -11

.....
↓
Candela IX

Migliore accendibilità: grazie alle dimensioni ridotte dell'elettrodo centrale vi è minore dissipazione di calore (vedere a pagina 31)

Dalla scintilla all'accensione

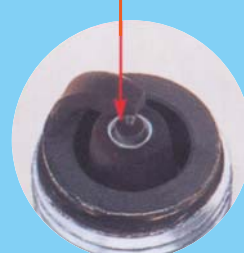

effetto corona * residui carboniosi

La mancanza di residui carboniosi sul doppio spigolo garantisce che la scintilla non venga mai scaricata a massa.

*L'effetto corona è dovuto alla ionizzazione delle molecole di gas ad opera del campo elettrico generato dal voltaggio applicato.

Il doppio spigolo assicura che la scintilla scocchi in qualsiasi condizione, bruciando i residui carboniosi e garantendo eccellenti partenze a freddo.

Come è fatta una candela racing?

E' una candela ad alte prestazioni per motori con alto rapporto di compressione ed elevato numero di giri.

Specifiche

Si utilizza in condizioni critiche quali forti accelerazioni e decelerazioni ripetute molto frequentemente, o lunghe percorrenze ad alta velocità.

Deve essere in grado di far sempre scoccare la scintilla, di incendiare rapidamente la miscela, di resistere alle alte temperature e di garantire ottima conducibilità termica, durata e resistenza meccanica.

Per soddisfare requisiti così severi le candele racing devono avere caratteristiche molto speciali:

1 Materiale dell'elettrodo

Solitamente è in metallo prezioso come platino, iridio o oro/palladio.

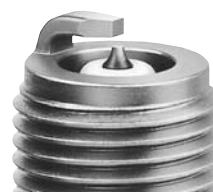

2 Configurazione dell'elettrodo

L'elettrodo sottile migliora l'emissione delle scintille ed aumenta l'accendibilità.

3 Forma della punta dell'isolatore

La particolare configurazione dell'isolatore ceramico favorisce l'immediato smaltimento di calore a tutti i regimi.

Tipi di candele racing

Standard

Elettrodo piatto

Punta dell'isolatore prominente

A scarica semi-superficiale

Elettrodo obliquo

Quali tipi di candele offrono una migliore resistenza ai depositi carboniosi?

Sono candele progettate in modo che la scintilla possa scoccare anche sulla superficie dell'isolatore. La scintilla, quindi, ripulirà regolarmente l'isolatore dai depositi carboniosi evitando così l'imbrattamento.

Esistono tre tipi diversi classificabili come “candele a scarica alternata”, “candele con gap supplementare” e “candele a scarica semi-superficiale”.

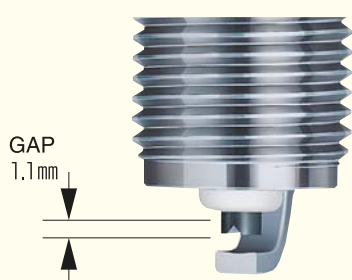

Specifiche

Candela a scarica alternata BKR6EK	Candele con gap supplementare BUR6ET	Candele a 4 elettrodi con scarica semi-superficiale BKR6EQUP
Residui carboniosi	Gap supplementare	Zona ripulita dai residui carboniosi
Di solito la scintilla scocca nello spazio presente tra i due elettrodi (spark gap): quando si verifica l'accumulo di residui carboniosi in alternativa la scintilla viene scaricata nello spazio tra l'elettrodo e l'isolatore (air gap), bruciando i depositi sulla superficie circoscritta di quest'ultimo e contribuendo ad evitare l'imbrattamento su quest'area.	Quando l'accumulo di residui carboniosi sull'isolatore diventa eccessivo, la scintilla può scoccare all'interno del gap supplementare, bruciando così i depositi carboniosi sulla superficie circoscritta dell'isolatore ed evitando l'imbrattamento su quest'area.	La candela a scarica semi-superficiale è progettata in modo che la scintilla scocchi lungo la superficie dell'isolatore tra l'elettrodo centrale e gli elettrodi di massa. La scintilla, quindi, ripulirà regolarmente l'isolatore dai depositi carboniosi evitando così l'imbrattamento.

Esistono altri tipi di candele speciali?

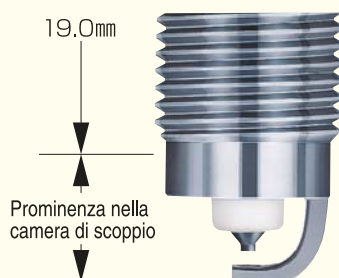

NGK produce diversi tipi di candele speciali, alcune delle quali, sono qui sotto raffigurate.

Gap maggiorato
Esempio: BKR5E-11

La distanza tra gli elettrodi può variare da 1,1 a 1,5 mm per migliorare l'accensione della miscela aria-benzina.

Corpo metallico esteso
Esempio: BKR6EPA-8

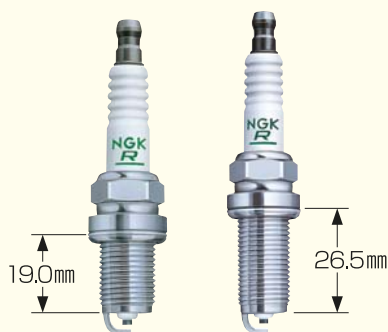

La conformazione degli elettrodi è tale da far scoccare la scintilla il più possibile verso il centro della camera di scoppio per una combustione più omogenea. N.B. Può essere usata solo in motori particolari.

Elettrodo centrale all'iridio
Esempio: BKR6EIX-11

La caratteristica di questa nuova candela è nell'elettrodo centrale con riporto all'Iridio saldato al laser, nel diametro ridotto dell'elettrodo, ancora più sottile di quello della candela al platino, ed in abbinamento all'elettrodo di massa rastremato migliorando l'accendibilità e assicurando accensioni pronte e accelerazioni progressive.

Candela con filettatura estesa
Esempio: LFR5A-11

L'estensione della candela contribuisce a migliorare la possibilità di raffreddamento della testa del cilindro. Questo tipo di candela verrà probabilmente installato su un numero sempre maggiore di motori nel futuro. La lettera "L" all'inizio del codice candela indica questa caratteristica.

Candela con corpo metallico parzialmente filettato
Esempio: CR9EH-9

Candela speciale con filettatura parziale, da utilizzare esclusivamente con applicazioni specifiche.

Compatta per piccoli motori
Esempio: BMR6A

Queste piccole candele vengono utilizzate su motori di dimensioni ridotte come quelli per motoseghe o tagliaerba.

Che cosa si intende per imbrattamento di una candela?

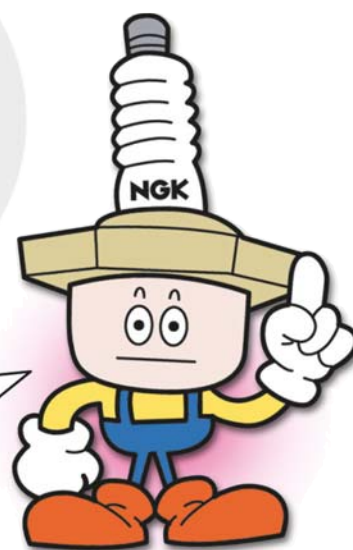

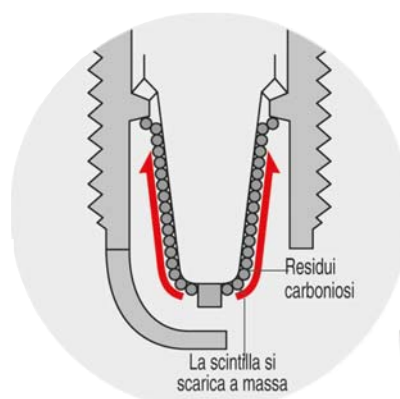

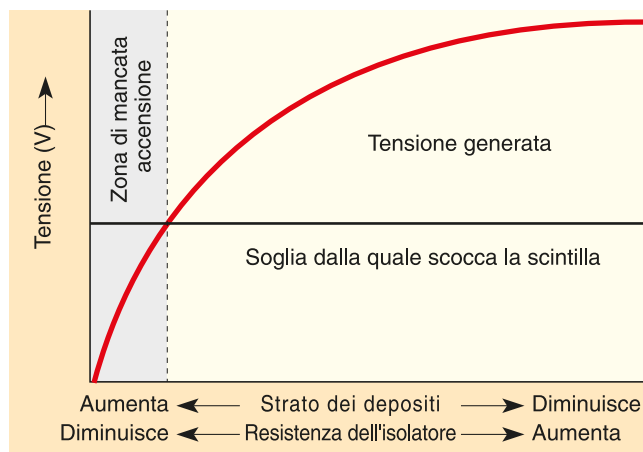

E' quel fenomeno per cui i residui carboniosi prodotti dalla combustione aderiscono alla punta dell'isolatore facendo scaricare a massa la scintilla e causando quindi mancate accensioni.

In caso di imbrattamento, l'alta tensione generata dall'impianto di accensione per far scoccare la scintilla si scarica a massa lungo i depositi carboniosi che sono ottimi conduttori elettrici. La conseguente mancata accensione della miscela dà luogo a problemi in fase di avviamento e può ridurre l'efficienza del catalizzatore.

Imbrattamento

Resistenza elettrica dell'isolatore in rapporto alla tensione generata dal sistema di alimentazione.

All'aumentare dello strato di residui carboniosi, l'efficacia dell'isolatore si riduce e la tensione applicata agli elettrodi diminuisce.

Quando la tensione scende al di sotto della soglia dalla quale scocca la scintilla, si verifica la mancata accensione della miscela aria/benzina.

Cause dell'imbrattamento e rimedi

CAUSE	RIMEDI
- Miscela aria/benzina troppo ricca - Errata taratura del carburatore - Errato funzionamento del sistema di iniezione - Inefficienza dell'impianto elettrico - Imperfetta connessione dei cavi di alta tensione - Condizioni particolari di guida - Prolungati periodi "al minimo" - Lunghi tratti percorsi a bassa velocità - Candela troppo fredda	- Eseguire la messa a punto del sistema di alimentazione. - Verificare gli allacciamenti dei cavi candele. - E' necessario ogni tanto raggiungere velocità dell'ordine di circa 80 km/h. - Utilizzare una candela più calda (esempio BPR6ES → BPR5ES)

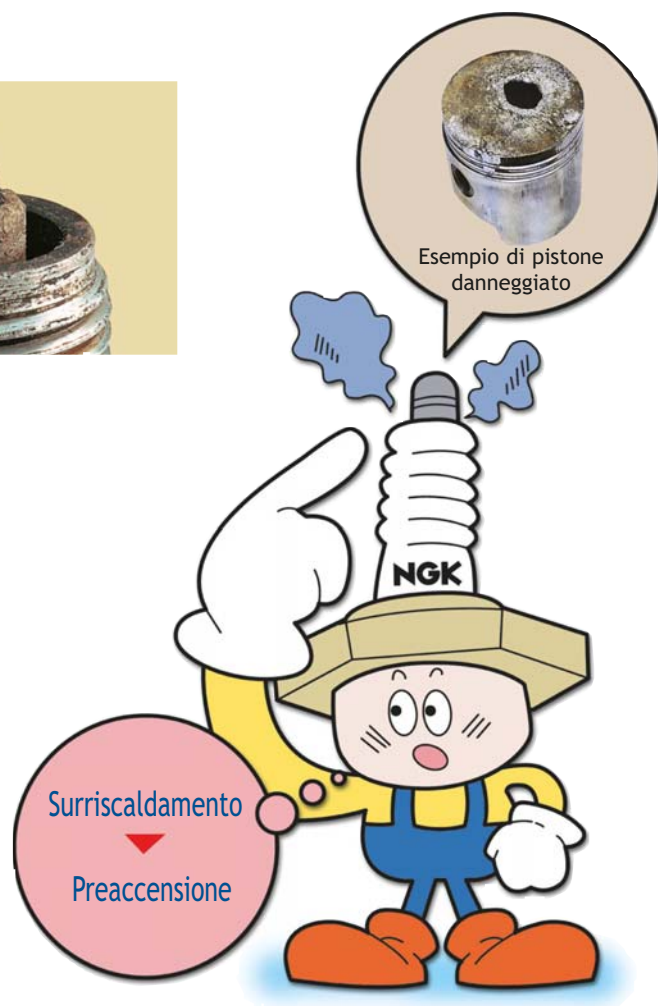

Che cosa si intende per surriscaldamento di una candela?

Un prolungato surriscaldamento può portare anomalie nella combustione (preaccensione), provocando la fusione degli elettrodi della candela.

Surriscaldamento

Una candela che abbia subito un surriscaldamento, presenta la parte terminale dell'isolatore punteggiata di depositi ed in casi più gravi fusione degli elettrodi. Quando la temperatura della candela supera gli 850°C nella zona degli elettrodi si può formare un punto caldo che può innescare la combustione prima dello scoccare della scintilla, provocando così una preaccensione con possibile danneggiamento del pistone.

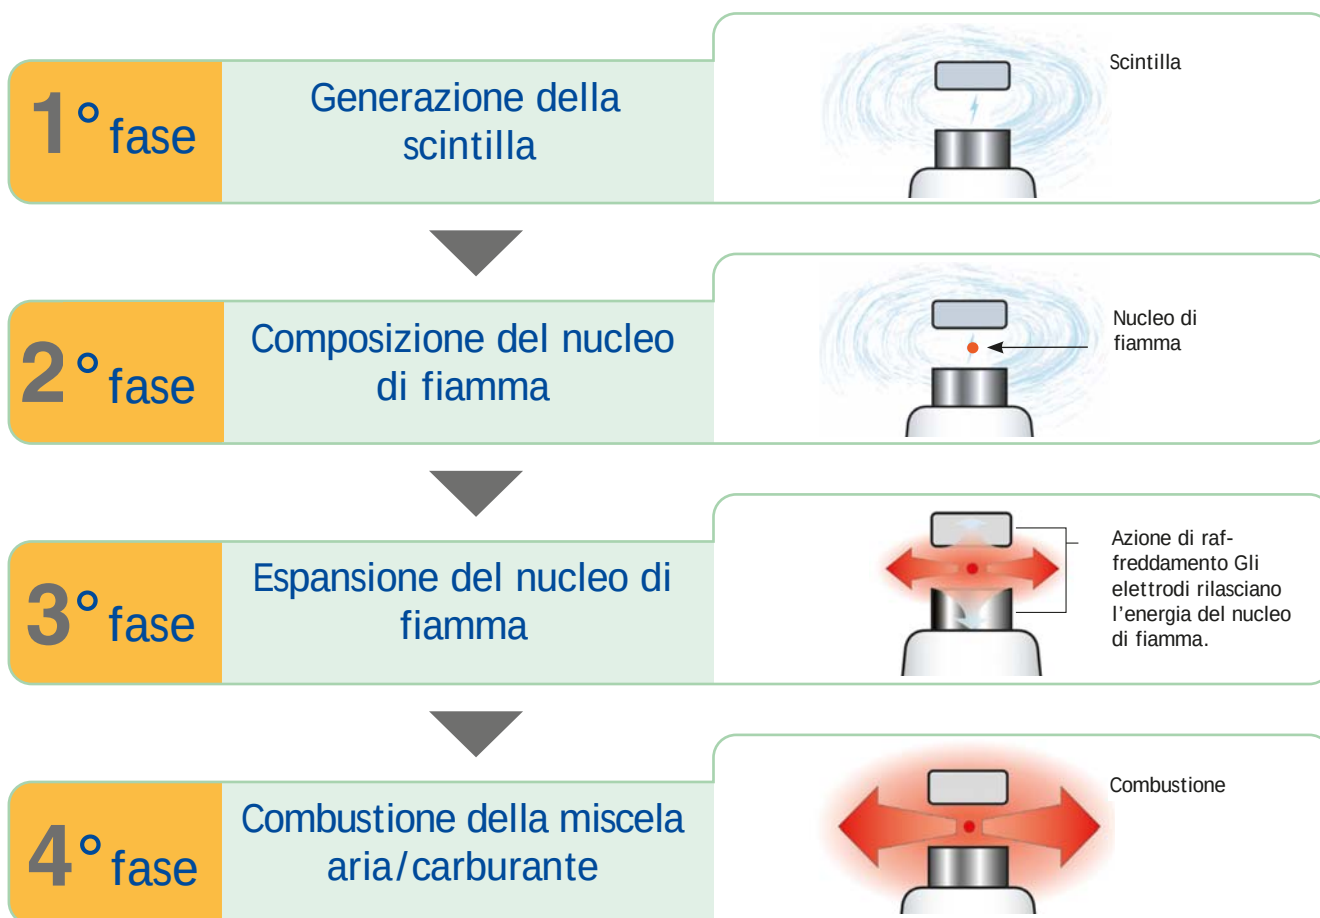

Cause del surriscaldamento e rimedi

CAUSE	RIMEDI
Accensione troppo anticipata	➤ Regolare l'anticipo di accensione.
Miscela aria/benzina troppo magra	➤ Regolare il rapporto aria/benzina.
Fluido di raffreddamento e/o lubrificante insufficiente	➤ Aggiungere liquido di raffreddamento e/o lubrificante.
Nel caso di motore turbo, pressione troppo elevata	➤ Regolare la pressione.
Coppia di serraggio delle candele troppo bassa	➤ Stringere fino alla coppia corretta.
Impiego di una candela troppo calda	➤ Utilizzare una candela più fredda (esempio BPR5ES ➔ BPR6ES)

Che cosa si intende per 'performance d'accensione'?

Si riferisce alla capacità del motore di bruciare, con successo ed efficienza, la miscela aria/carburante: la candela contribuisce in maniera fondamentale alla performance d'accensione

Vi sono quattro fasi dal momento in cui la scintilla viene generata all'interno del gap fino alla combustione della miscela aria/carburante.

Il raffreddamento avviene nel punto in cui l'elettrodo centrale e quello di massa (più freddi) sottraggono l'energia del nucleo di fiamma tramite trasmissione di calore. Se il raffreddamento è consistente il nucleo di fiamma può estinguersi, provocando così una mancata accensione. Perciò le candele sono state progettate per ridurre l'effetto di raffreddamento ed avere una migliore performance d'accensione.

NGK propone i seguenti tipi di candele per migliorare la performance d'accensione

- **Candele V-Groove**
Elettrodo centrale con scanalatura a V di 90° (vedere a pag.28)
- **Candele Iridium IX**
Elettrodo centrale fine con riporto all'Iridio saldato al laser (vedere a pag.29)
- **Candele con gap maggiorato**
Il gap maggiorato contribuisce a ridurre l'effetto raffreddamento (vedere a pag.30)
- **Candele con area d'accensione prominente**
La scintilla scocca più vicino al centro della camera di combustione (vedere a pag.30)

L'alone giallo-bruno tra corpo metallico e isolatore è causato dal trafilamento dei gas?

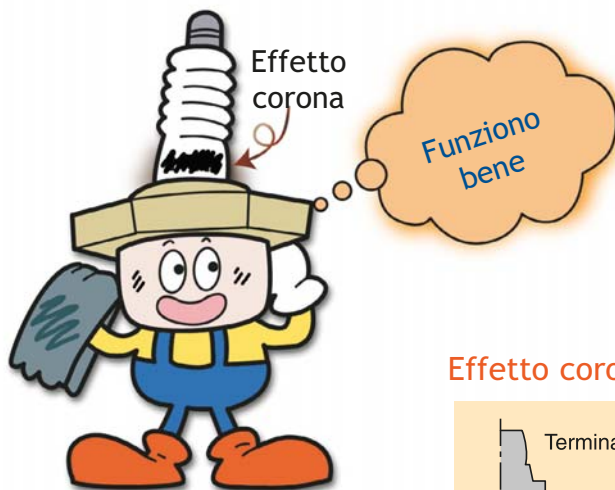

No. L'alone non è dovuto al trafilamento dei gas dalla camera di combustione ma all'effetto corona.

Quando si rimuove la candela si può talvolta rilevare un alone giallo-bruno sull'isolatore in prossimità del corpo metallico.

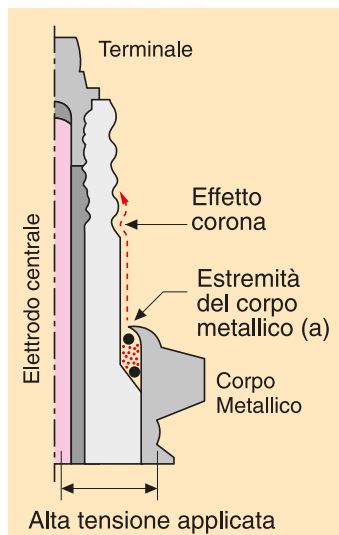

Questo alone è dovuto alle particelle d'olio disperse nell'aria intorno alla candela che si fissano elettrostaticamente, data l'alta tensione, sulla superficie dell'isolatore. Questo fenomeno non influisce sul rendimento della candela.

Alone sull'isolatore

Effetto corona

MEMO

Effetto corona

Tra l'isolatore ed il corpo metallico c'è un gap (distanza tra i due particolari). Quando si applica l'alta tensione alla candela, la stessa differenza di potenziale che si instaura tra l'elettrodo centrale ed il corpo metallico provoca una caduta del grado di isolamento dell'aria contenuta in tale gap (a). Questo è ciò che genera la "scarica esterna" che si propaga dalla bordatura superiore del corpo metallico, ove l'intensità del campo elettrico è maggiore, al terminale ad oliva. Nell'oscurità è riconoscibile per il classico colore azzurro pallido.

Quali precauzioni si devono prendere durante l'installazione delle candele?

E' necessario applicare la **corretta coppia di serraggio**.

Avvitare secondo la coppia di serraggio specificata

Se la coppia è eccessiva

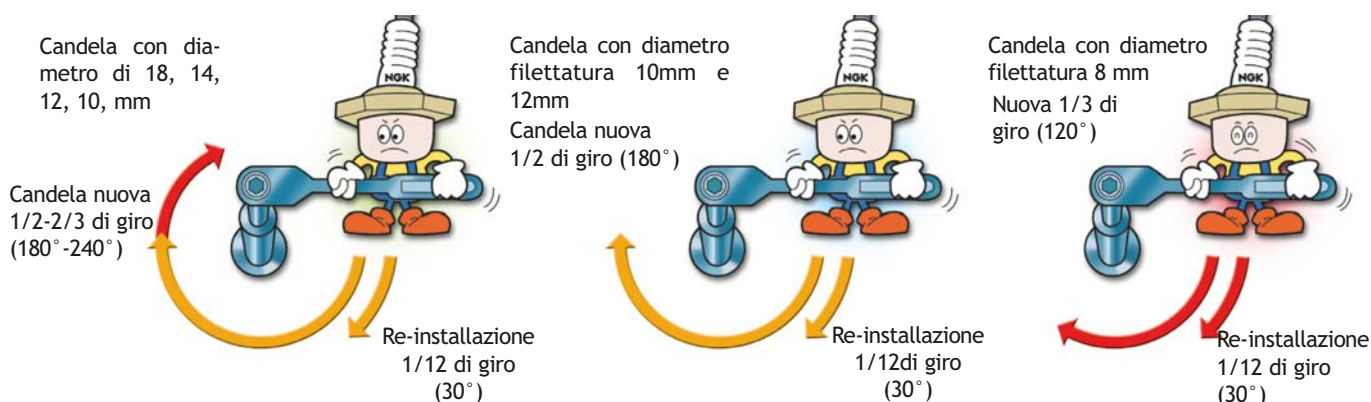

► può causare rotture del corpo metallico

Se la coppia è insufficiente

► può causare surriscaldamenti

Diametro di filettatura	Coppia di serraggio
18 mm	da 35 a 40N·m (3.5 to 4.0 kgm)
14 mm	da 25 a 30N·m (2.5 to 3.0 kgm)
12 mm	da 15 a 20N·m (1.5 to 2.0 kgm)
10 mm	da 10 a 12N·m (1.0 to 1.2 kgm)
8 mm	da 8 a 10N·m (0.8 to 1.0 kgm)

E' fondamentale che la candela sia installata in base alla coppia di serraggio specificata. Dapprima, se possibile, avvitare la candela a mano fino a portare la guarnizione a contatto con la testata, poi stringere secondo la coppia di serraggio come da tabella.

Possibili danneggiamenti provocati durante l'installazione

	Filettatura danneggiata	Corpo metallico danneggiato	Rottura dell'isolatore
Analisi visiva	Danneggiamento dei primi filetti 	Rottura sotto l'esagono  Rottura alla base del filetto 	Rotture sulle coste 
Cause	Candela avvitata disassata	Eccessivo serraggio	Chiave disassata o inadeguata
Azioni correttive	Avvitare inizialmente la candela a mano e non direttamente con la chiave	Applicare la coppia di serraggio corretta	Usare una chiave di buona qualità

Oltre a verificare il corretto grado termico, quali altre precauzioni bisogna adottare durante l'installazione delle candele?

Bisogna assicurarsi che la lunghezza della filettatura e della estensione del corpo metallico della candela siano corrette.

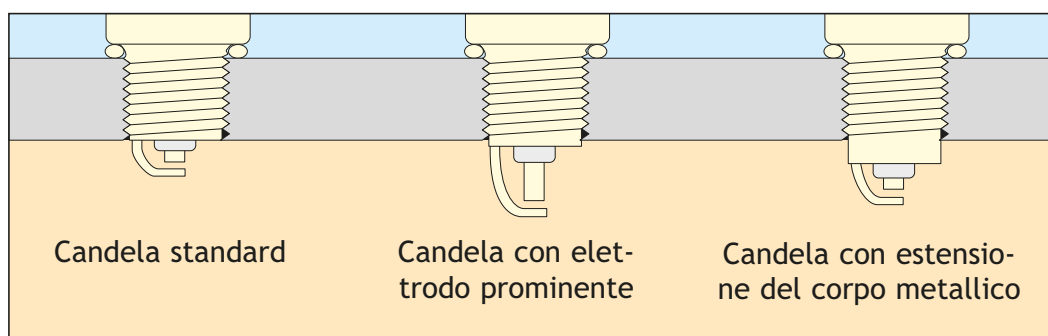

Selezionare la candela con la giusta lunghezza della filettatura.

Diversamente il motore potrebbe non funzionare correttamente o comunque avere dei problemi.

Selezionare la candela con la giusta estensione di corpo metallico.

Diversamente il motore potrebbe non funzionare correttamente o comunque avere dei problemi: utilizzare esclusivamente candele con le specifiche consigliate dal produttore.

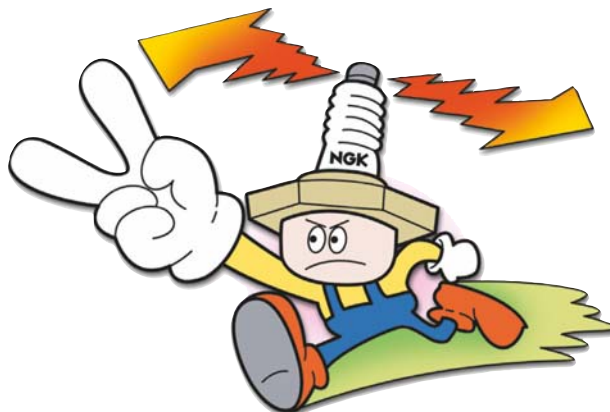

Alcune volte smontare una candela può essere difficile e si può correre il rischio, nel caso di forzatura eccessiva, di romperla e lasciare la sezione filettata all'interno della testa cilindro. Un consiglio per facilitare questa operazione: avviare il motore per qualche istante e fare in modo che la testa cilindro si riscaldi, poi applicare dell'olio di modo che penetri nella parte filettata, infine, dopo qualche attimo, provare a rimuovere la candela.

Perchè è necessario sostituire la candela?

La sostituzione periodica della candela contribuisce al buon funzionamento del motore e all'efficienza del catalizzatore.

Problemi causati dall'uso eccessivamente prolungato

- Gli elettrodi usurati ostacolano la formazione della scintilla.
- I depositi accumulati sulla punta dell'isolatore possono provocare anomalie nella combustione (preaccensione) e causare problemi che possono portare alla fusione degli elettrodi.

NORMALE	ELETTRODI USURATI	IMBRATTAMENTO	DEPOSITI
			
	Se i bordi degli elettrodi sono consumati ed arrotondati, la scintilla non scocca con facilità causando problemi al motore e mancate accensioni. Il motore non riesce a erogare la massima potenza.	La tensione si scarica lungo i residui carboniosi accumulatisi sulla punta dell'isolatore causando mancate accensioni durante la marcia e ostacolando l'accensione del motore all'avviamento.	I depositi accumulati sulla punta dell'isolatore si surriscaldano causando anomalie nella combustione (preaccensione) che possono portare alla fusione degli elettrodi.

Le mancate accensioni sono la causa principale della riduzione dell'efficienza del catalizzatore.

Queste candele devono essere sostituite.

Questi fenomeni possono anche essere provocati da una inadeguata manutenzione del motore (impianto di alimentazione e di iniezione) e da una errata selezione del tipo di candela.

GUIDA AL CORRETTO UTILIZZO DELLE CANDELETTE

INDICE

Candelette ad incandescenza NGK: tipi e caratteristiche	41
Candeletta con bulbo metallico	43
Candeletta con bulbo ceramico	44
Uso corretto delle candele ad incandescenza	45
Decodifica dei codici candele	47

INTRODUZIONE

Il funzionamento dei motori Diesel è basato sul calore generato dalla compressione dell'aria aspirata dal cilindro: questa compressione sviluppa pressioni di 30-35 bar, riscaldando l'aria sino a 700-900°C; quindi il gasolio viene iniettato nella camera di combustione, la miscela aria-combustibile si accende innescando la combustione che fa funzionare il motore.

Nell'avviamento a freddo, con temperatura ambiente bassa e motore freddo, la temperatura raggiunta da questa compressione è spesso insufficiente per accendere il motore: la candele ad incandescenza è un primo aiuto, che viene installato nella testa cilindri affinché il proprio elemento riscaldante sia proteso direttamente all'interno di ciascuna camera di combustione. Prima dell'avviamento del motore la candele riceve tensione elettrica dalla batteria (periodo di preriscaldamento) e trasforma questa tensione in energia termica all'interno della camera di combustione; il calore generato dalla candele ad incandescenza (la temperatura arriva a 800-900°C) crea le condizioni ideali per l'accensione della miscela, migliorando la qualità della combustione e perciò contribuendo alla riduzione di emissioni nocive.

Poiché la candele è esposta al processo di combustione, deve essere in grado di sopportare elevate temperature, alta pressione e corrosione chimica; inoltre la candele deve raggiungere e mantenere la temperatura di funzionamento rapidamente e per molti cicli.

Le candele ad incandescenza richiedono alcune forme di controllo, effettuate sia manualmente da parte del tecnico installatore, sia attraverso l'ausilio di alcuni sistemi esterni di controllo, che regolano il voltaggio applicato per un periodo di tempo prestabilito. Solitamente in questi sistemi una spia luminosa indica la fase di pre-riscaldamento.

Inefficienze del motore o del sistema di alimentazione non sono generalmente riconducibili alle candele. Una grave perdita della compressione o difficoltà nel sistema di iniezione carburante possono impedire l'accensione e ridurre la durata di una candele.

Candele ad incandescenza NGK: tipi e caratteristiche

1 Tipi di candele ad incandescenza NGK

Vi sono molti tipi di candele ad incandescenza disponibili per essere installate sulla vasta gamma di motori diesel esistenti; in linea di massima le candele NGK possono essere classificate in due gruppi: le candele con bulbo metallico, in cui la spirale è protetta da un fodero metallico con elevata resistenza alle alte temperature e quelle con bulbo ceramico, in cui la spirale di riscaldamento è racchiusa all'interno di un fodero ceramico.

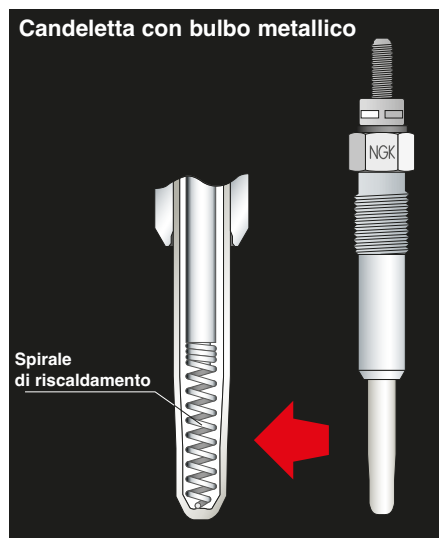

Es: QGS = Candele a riscaldamento rapido
SRM = Candele metallica autoregolante

2 Caratteristiche delle candele ad incandescenza NGK

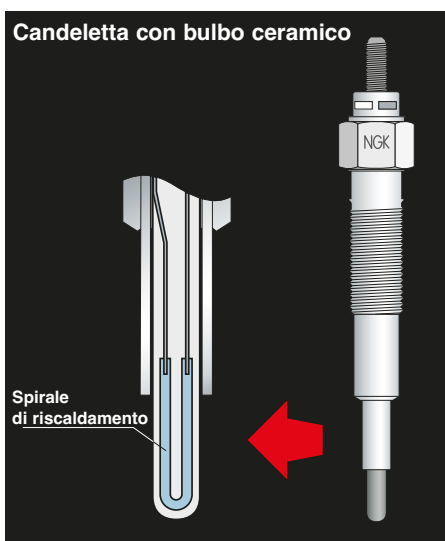

Candele con bulbo metallico

In questo tipo di candele la spirale di riscaldamento e quella di regolazione (quando è presente) sono protette da un bulbo metallico con elevata resistenza alle alte temperature e sono annegate, all'interno di quest'ultimo, in una polvere di ossido di magnesio compattata, elettricamente isolante e ad alta conducibilità termica: grazie ad essa i sottili fili delle spirali rimangono ben posizionati e resistenti alle vibrazioni.

Le spirali perciò non vengono esposte direttamente al processo di combustione e agli shock prodotti dalla rapida espansione dei gas; inoltre la protezione del bulbo metallico impedisce che il carbonio prodotto dal processo di combustione non si depositi sulla spirale di riscaldamento, causando corto circuito.

Candele con bulbo ceramico

Candele con bulbo ceramico

La candela con bulbo ceramico presenta una maggiore resistenza alle alte temperature da parte della spirale di riscaldamento racchiusa nella nuova particolare ceramica al nitrato di silicio.

Il nitrato di silicio è un ottimo conduttore del calore e quindi il riscaldamento avviene in maniera più rapida; inoltre è in grado di sopportare tempi di riscaldamento estremamente veloci per lunghi periodi di esercizio.

Rispetto alla candela con bulbo metallico, quella con bulbo ceramico ha una maggiore resistenza e durata.

Candeletta con bulbo metallico

1 Tipi

Vi sono quattro tipi di candelette con bulbo metallico: standard, a riscaldamento rapido, QGS (Quick Glow System – sistema preriscaldamento rapido) e il tipo SRM (Self Regulating Metal – candeletta metallica autoregolante)

2 Caratteristiche di temperatura e di corrente

1. Standard

Il tipo standard ha una sola spirale di riscaldamento e la resistenza elettrica non cambia se la temperatura aumenta: quindi il consumo di corrente è costante.

2. A riscaldamento rapido

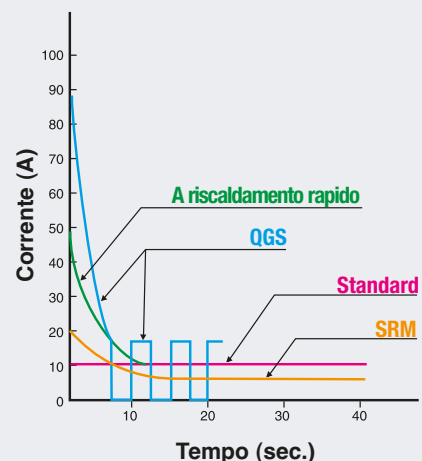

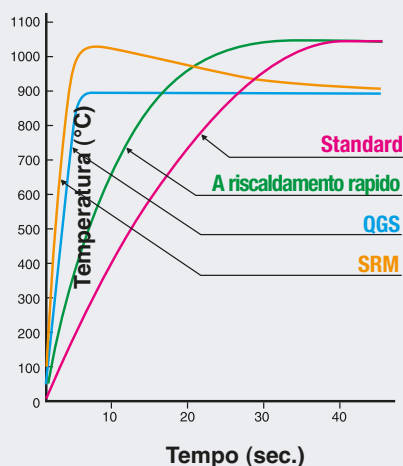

Questo tipo ha una sola spirale di riscaldamento e la resistenza elettrica si modifica al cambiare della temperatura. Quando si applica inizialmente il voltaggio di alimentazione, si ha una bassa resistenza che permette il passaggio di una elevata corrente nella spirale di riscaldamento, abbreviando il periodo di preriscaldamento. Non appena la temperatura aumenta la resistenza elettrica cresce, riducendo il flusso di corrente.

3. QGS (sistema preriscaldamento rapido)

La candeletta con Quick Glow System innalza la sua temperatura in maniera estremamente rapida, ma essa viene utilizzata esclusivamente in abbinamento ad una speciale unità di controllo QGS. Vi sono due tipi di candelette QGS non intercambiabili: quello con una spirale e quello con due spirali. Il tipo con spirale di riscaldamento singola ha una resistenza bassa al fine di far fluire una corrente elevata. Mentre quello con due spirali ha una spirale di riscaldamento e una di regolazione la cui resistenza aumenta al crescere della temperatura, limitandone il picco massimo. Grazie alla propria struttura queste candelette hanno un periodo di preriscaldamento molto rapido e una migliore capacità di accensione; comunque, se il voltaggio viene applicato per un periodo troppo lungo e la temperatura si innalza troppo, la spirale di riscaldamento potrebbe fondersi e rompersi. Quando la temperatura della candeletta raggiunge approssimativamente i 900°C il controller (o relay) deve abbassare la corrente o spegnerla, al fine di regolarne la temperatura.

4. SRM autoregolante

La candeletta SRM è a doppia spirale: la prima (di riscaldamento) alza rapidamente la temperatura, mentre la seconda (di regolazione) aumenta la resistenza elettrica al crescere della temperatura. Grazie alle speciali proprietà elettriche della spirale di regolazione, la candeletta SRM può fornire un periodo di riscaldamento rapidissimo e controllare la temperatura finale autonomamente. Perciò viene richiesto il minimo controllo esterno di questo sistema di preriscaldamento, fornendo ottime performance di pre e postriscaldamento.

Candeletta con bulbo ceramico

1 Tipi

Vi sono due tipi principali di candelette ceramiche: QGS (Quick Glow System – sistema preriscaldamento rapido) e SRC (Self-Regulating Ceramic - candeletta ceramica autoregolante).

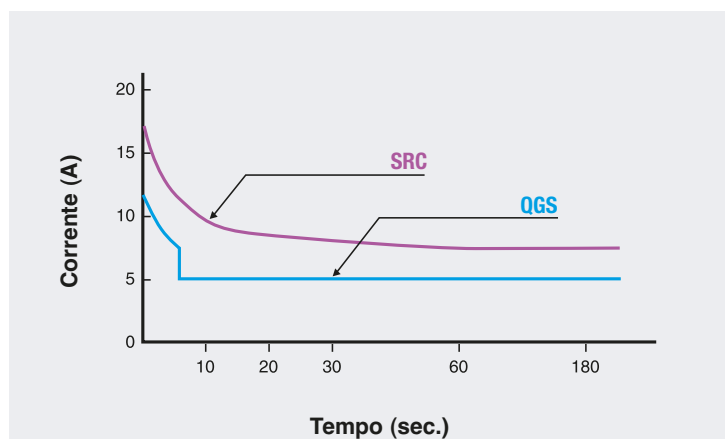

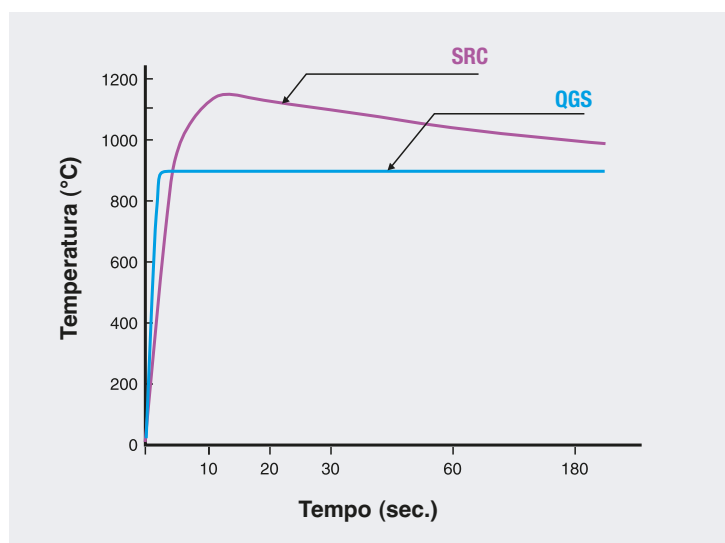

2 Caratteristiche di temperatura e corrente

1. QGS

In questo tipo la temperatura si innalza in maniera estremamente rapida (ancora più velocemente che nel tipo QGS con bulbo metallico); il voltaggio applicato deve essere controllato accuratamente dal controller o dall'apposito relé.

1. SRC

E' simile al tipo SRM con bulbo metallico e presenta una spirale di riscaldamento e una spirale di regolazione al fine di ridurre la corrente non appena la temperatura aumenta. Questa candeletta richiede il minimo intervento da parte del controller poiché ha la capacità di autoregolarsi.

Uso corretto delle candele ad incandescenza

1 Generale

Se il voltaggio o la capacità della batteria fossero troppo bassi la candele non si riscalderebbe a sufficienza e potrebbe verificarsi una mancata accensione del veicolo. Se il voltaggio fosse troppo elevato la spirale di riscaldamento potrebbe fondere o potrebbe compromettere la durata della candele.

Il tempo di preriscaldamento delle candele con *bulbo metallico* a spirale singola è di circa 25 secondi per il tipo standard, da 13 a 17 secondi per il tipo con riscaldamento rapido e da 6 a 10 secondi per il tipo QGS, mentre per quelle a spirale doppia è di circa 6 secondi per il tipo QGS e di 4 secondi per il tipo SRM.

Per quanto riguarda le candele con *bulbo ceramico*, il tempo di riscaldamento è di 3 secondi per il tipo QGS e, di 4 secondi per il tipo SRC.

Tempo di preriscaldamento

Tipi di candele ad incandescenza				Tempo di preriscaldamento
Bulbo metallico	Spirale singola	Standard	es. Y-103-2, Y-173	20-25 secondi fino a 800°C
		Riscaldamento rapido	es. Y-103 V , Y-106 V	15-17 secondi fino a 800°C
			es. Y-128 T , Y-204 T S 1	13-14 secondi fino a 800°C
		QGS	es. Y-112 M 1	10 secondi ca. fino a 900°C
			es. Y-107 R , Y-112 R 1	6 secondi ca. fino a 900°C
	Spirale doppia	QGS	es. Y- 7 07 R S, Y- 7 02 U	6 secondi ca. fino a 900°C
		SRM	es. Y- 7 01 J , Y- 5 15 J	4 secondi ca. fino a 900°C
Bulbo ceramico	QGS		es. C Z 01, C X 01	3 secondi ca. fino a 900°C
	SRC		es. C Y 01	4 secondi ca. fino a 900°C

In caso di difficoltà di avviamento non lasciare il circuito in tensione: la batteria si potrebbe scaricare e si ridurrebbe la durata della candele. Si consiglia di spegnere il motore, attendere qualche secondo e riprovare.

Maneggiare con cura la candele ceramica: in caso di caduta la ceramica si potrebbe danneggiare e renderebbe la candele inutilizzabile.

2 Analisi del funzionamento

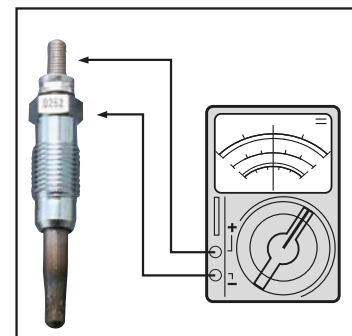

[Candeletta con bulbo metallico]

Al fine di controllare una spirale di riscaldamento danneggiata è necessario misurare la resistenza tra il terminale e il corpo metallico (figura a lato). Prima del test assicurarsi che vi sia un buon contatto, rimuovendo tracce di ruggine, di sporco, di olio o di vernice.

Se il valore della resistenza = ∞ : la spirale di riscaldamento è rotta.

Se il valore della resistenza $\leq 5\Omega$: la spirale di riscaldamento è in ottime condizioni.

Alcuni valori di resistenza sono estremamente bassi e solo misuratori in grado di registrare questi valori devono essere utilizzati. Per esempio il valore di resistenza di una candele QGS a temperatura ambiente potrebbe essere di $0,1\Omega$.

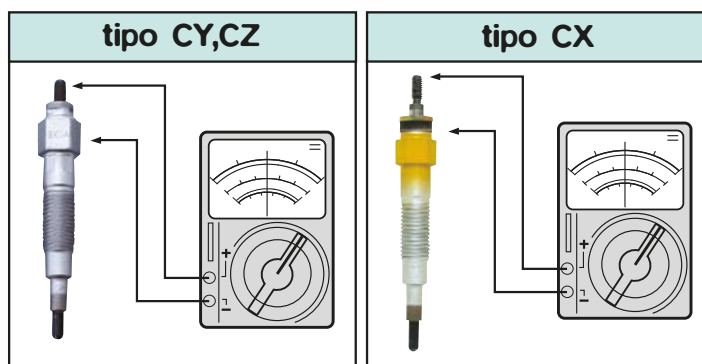

- ◆ E' sconsigliabile controllare la funzionalità di una candele applicando il voltaggio della batteria fino al riscaldamento: la temperatura della spirale di riscaldamento potrebbe essere innalzata sino al punto di rottura, prima che il bulbo appaia ben riscaldato; questo avviene specialmente per le candele QGS, inoltre bisogna prestare attenzione per evitare di scottarsi.

[Candeletta con bulbo ceramico]

Il valore di resistenza delle candele ceramiche è genericamente al di sotto di 1Ω .

Al fine di controllare un'eventuale rottura della spirale di riscaldamento la resistenza dovrebbe essere verificata connettendo il misuratore direttamente alla candele ancora installata nel motore, questo per evitare danni meccanici che potrebbero avvenire in caso di rimozione. Inoltre bisogna assicurarsi che vi sia un'ottima connessione alla candele per garantire interpretazioni corrette.

Nel tipo CY la resistenza dovrebbe essere di $0,5\Omega$

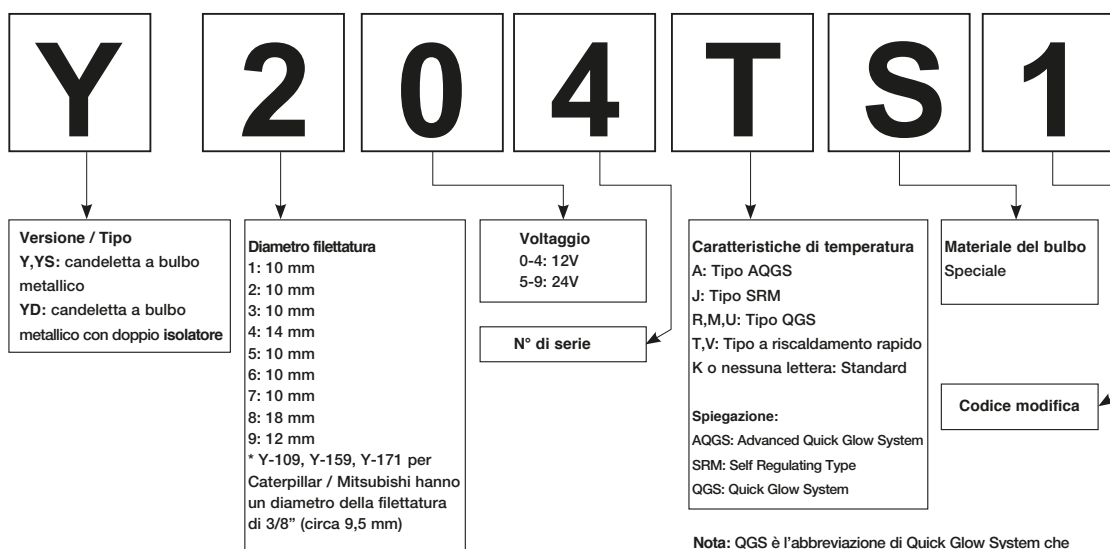

Nei tipi CZ e CX la resistenza dovrebbe essere di $0,7\Omega$

Nelle candele CY e CZ la massa scarica attraverso il loro corpo metallico, mentre il tipo CX presenta un doppio isolatore. Qui sopra i diagrammi illustrano i punti di connessione al misuratore.

Decodifica dei codici candele

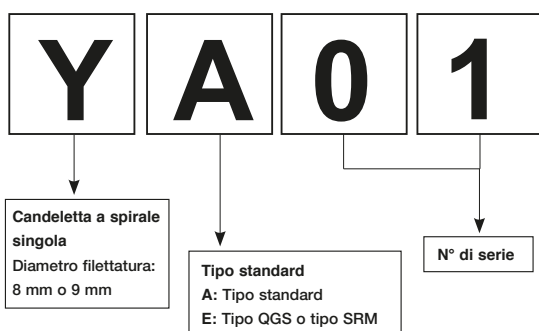

Candeletta con bulbo metallico

Candeletta con bulbo metallico

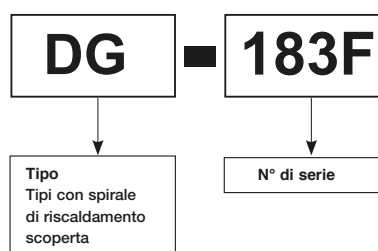

Nota: QGS è l'abbreviazione di Quick Glow System che significa sistema di preriscaldamento rapido. Questo sistema è composto da un controller che gestisce la tensione di preriscaldamento in funzione di diversi parametri.
